no database**

COMPANY EMAIL

hr@rslinksconsultants.com

TOTAL SIZE

About 3 MB · 11 pages

SERVER NEEDS

**Any web
hosting**

CONTACT

+92 371 9051589

What you are publishing

The website is a finished, ready-to-publish **static website** made of HTML, CSS, JavaScript and image files. There is **no WordPress, no database, no PHP and nothing to install or build**. Uploading the files to the domain's web folder is all that is needed for it to go live.

In short: upload the contents of the `upload-to-public_html` folder into `public_html` for `rslinksconsultants.com`, turn on free SSL, and create the mailbox `hr@rslinksconsultants.com`.

What is in this package

```
RS-Links-Hosting-Package/
├── READ-ME-FIRST - Website Handover Guide.pdf    ← this guide
├── upload-to-public_html/                        ← the website (upload everything inside)
│   ├── index.html                               home page
│   ├── recruitment.html countries.html consultancy.html visas.html
│   ├── partnerships.html about.html contact.html
│   ├── privacy.html terms.html 404.html
│   ├── assets/ (css, js, images, flags)
│   ├── .htaccess                               server settings (hidden file)
│   ├── sitemap.xml robots.txt site.webmanifest
│   └── HOSTING-INSTRUCTIONS.txt                 short text version of this guide
├── logos/                                       logo files (PNG + SVG) for email signatures etc.
└── letterhead/                               company letterhead (PDF)
```

Upload to the hosting (cPanel)

1 Open File Manager

Log in to cPanel for `rslinksconsultants.com` and open **File Manager**. Go to the `public_html` folder (or the document root assigned to this domain).

2 Clear the default page

Delete any placeholder files the hosting company put there, such as `index.php`, `default.html` or a "coming soon" page. Leave `cgi-bin` and `.well-known` if they exist.

3 Upload the files

Upload **everything inside** `upload-to-public_html`, not the folder itself. Easiest way: zip the contents of that folder, upload the zip into `public_html`, right-click it and choose **Extract**, then delete the zip.

`index.html` must end up directly inside `public_html`, with the `assets` folder next to it.

4 Check the hidden file

In File Manager, open **Settings** → **Show Hidden Files** and confirm `.htaccess` was uploaded. It shows our own "page not found" page and speeds up loading.

5 Open the website

Visit <http://rslinksconsultants.com>. The RS Links home page should appear with the animated map, menu and logo.

Using FTP instead (FileZilla or similar)

Connect with the FTP details from the hosting account, open the `public_html` folder on the server side, and drag in all files and folders from `upload-to-public_html`. Make sure hidden files are shown so `.htaccess` is transferred.

Other hosting types

The site also works unchanged on Netlify, Cloudflare Pages, Vercel, GitHub Pages, Hostinger, Bluehost, GoDaddy or any Apache/Nginx/LiteSpeed server. Just publish the same folder as the site root.

3 • DOMAIN

Point rslinksconsultants.com to the hosting

If the domain was bought from the **same company** as the hosting, it is usually connected already. Otherwise, update the domain's DNS at the registrar using one of these options:

OPTION	WHAT TO SET
A. Nameservers (simplest)	Change the domain's nameservers to the ones given in the hosting welcome email (e.g. <code>ns1.yourhost.com</code> , <code>ns2.yourhost.com</code>).
B. DNS records	<code>A</code> record for <code>@</code> → hosting server IP <code>CNAME</code> record for <code>www</code> → <code>rslinksconsultants.com</code>

DNS changes usually take a few minutes to a few hours, and occasionally up to 24–48 hours, to work everywhere.

Turn on HTTPS (free SSL)

1 Issue the certificate

In cPanel open **SSL/TLS Status** and click **Run AutoSSL** (or use the host's Let's Encrypt tool). Include both `rslinksconsultants.com` and `www.rslinksconsultants.com`.

2 Force HTTPS

Once `https://rslinksconsultants.com` opens without a warning, edit `.htaccess` and remove the `#` at the start of the three lines under "Force HTTPS". All visitors will then be sent to the secure address.

Important: do not enable the "Force HTTPS" lines before the certificate is working, or visitors will see a security error.

Create `hr@rslinksconsultants.com`

The website, letterhead and contact pages show `hr@rslinksconsultants.com`, so this mailbox must exist and receive mail.

1 Create the mailbox

cPanel → **Email Accounts** → **Create**. Username `hr`, domain `rslinksconsultants.com`, a strong password, and a reasonable storage quota.

2 Check mail records

If the domain's DNS is not managed by the hosting, make sure the `MX` record points to the hosting's mail server, and add the SPF/DKIM records cPanel shows under **Email Deliverability** so our emails don't land in spam.

3 Hand over access

Share the **webmail address** (usually `rslinksconsultants.com/webmail`) and the mailbox password with RS Links **privately and in person or by phone**, plus the IMAP/SMTP settings for phones (cPanel → Email Accounts → **Connect Devices**).

Please confirm before handing back

- ☐ <https://rslinksconsultants.com> and <https://www.rslinksconsultants.com> both open the home page with a padlock.
- ☐ All menu pages open: Home, Industries, Countries, Consultancy, Visas & Study, Partnerships, About, Contact.
- ☐ Logo, flags and the animated backgrounds appear (no broken images).
- ☐ A wrong address (e.g. rslinksconsultants.com/test) shows the RS Links "page not found" page.
- ☐ The green WhatsApp button opens a chat with +92 371 9051589.
- ☐ On the Contact page, "Send enquiry" prepares a WhatsApp message.
- ☐ Facebook and Instagram buttons open the company pages.
- ☐ An email sent to hr@rslinksconsultants.com is received, and a reply from it arrives (not in spam).
- ☐ The site looks correct on a mobile phone.

Recommended (optional)

- Add the site to **Google Search Console** and submit <https://rslinksconsultants.com/sitemap.xml> .
sitemap.xml and robots.txt are already set for rslinksconsultants.com.
- Create a **Google Business Profile** for the Rawalpindi office so the company appears on Google Maps.
- Keep the hosting and domain set to **auto-renew**, and share the renewal dates with RS Links.

How changes will be published

When RS Links needs changes, you will receive an updated website folder. To publish it, **upload the new files over the old ones** in `public_html` (choose "overwrite"). Nothing else needs to change.

Automatic updates (optional): the website's source is kept in a GitHub repository. If you prefer, connect the hosting to it (cPanel **Git Version Control**, or an FTP deploy) so updates go live automatically. Any login details for this must be entered directly into the hosting or GitHub settings, **never sent by chat or email**.

Where things are edited (for a developer)

FILE	CONTROLS
<code>assets/js/config.js</code>	Company name, phone, WhatsApp, email, address, hours, Facebook/Instagram links, form settings
<code>assets/js/data.js</code>	Industries and job titles, countries, visit-visa, study and residency destinations
<code>assets/css/site.css</code>	Colours, fonts and layout
<code>assets/img/</code>	Logo, favicon and social-sharing image

Technical notes

- Fonts load from Google Fonts. All other files are self-hosted.
- Forms do not need a mail server: enquiries are handed to WhatsApp. If email delivery of forms is wanted later, a Formspree address can be added in `config.js`.
- No cookies, tracking or analytics are installed. Google Analytics can be added on request.
